Power Plant Operator Training Course

Introduction

A power plant is an engineering facility used to generate electricity with the help of one or more generators, transforming energy from different sources into electrical power. Power plant operators regulate and supervise boilers, turbines, generators, and auxiliary equipment in power-generating plants. These operators also balance power demands among generators, synchronize power outputs, and monitor devices to maintain voltage and regulate electricity flow from the plant.

This training course by Xcelerate Training Institute provides a comprehensive understanding of the basic principles and selected in-depth knowledge regarding the operation, control, construction, fabrication, and composition of popular fossil-fueled power plants, including thermal, gas, and diesel power stations.

Learning Objectives

Upon completing this Certified Power Plant Operator course, participants will be able to:
