Project Quality Management

Introduction

What is meant by project quality?

Project quality management is the functional process of measuring the quality of project activities. This is done to ensure that the inherent characteristics of the project output/deliverable fulfill the requirements as per the client's expectations. While 'quality' may imply perfection, it implies the ultimate characteristics of a project, that matches customers' or stakeholders' expectations. The final quality must match their needs and wants from the project. Therefore, quality can vary vastly from project to project, depending on the agreement of stakeholders.

Who is responsible for project quality?

To ensure the expected quality requirements are met, you must identify and document the needs of the customer/stakeholder. This is the project quality manager's responsibility. They ensure quality expectations are met to sign and agree on specifications. This could also potentially mean that it could be possible to have a high-quality, low-grade product, however, it is never acceptable to have a low-quality, any-grade product.

Modern quality management and project management are complementary. Quality management is not an event, but a process of consistently delivering high-quality products or services. It is a continual sequence of measuring quality, updating processes, and establishing the right controls repeatedly until the desired quality is achieved.
