Process Plant Optimization Technology and Continual Improvement Training Course

Introduction

Introduction

Process Plant Optimization requires effective management of maintenance operations and optimization of equipment, along with plant reliability and availability.

The vital aspects of process plant optimization are related to system energy management and the reduction of energy consumption. Many industrial processes and systems currently offer significant potentials for savings. However, bringing significant process changes such as modern controls and newer technologies can also enhance the opportunities for plant optimization. This course will discuss the importance of monitoring and adjusting process plant operations to sustain optimum levels of efficiency while maintaining consistently safe and reliable operational procedures.

Operational reliability and consistency are the bases of process plant optimization, so any disruptions must be kept to a minimum for the plant operations to be sustainable. This requires the effective management of the degradation processes that affect the equipment and systems. It also requires competent resources to implement effective inspection and maintenance strategies, plans, and methods.

Optimizing an existing plant is an effective method of achieving higher profitability without bearing any large investment costs associated with building a new plant from scratch.

This Xcelerate Training Institute course will provide you with a comprehensive view of the various aspects of process plant integrity and the essential foundation for sustainable plant profitability and optimization.
